

Figure 1 shows a 6x10 grid of 60 Braille characters. The characters are arranged in six rows and ten columns. The first row contains 10 characters, the second row contains 10 characters, the third row contains 10 characters, the fourth row contains 10 characters, the fifth row contains 10 characters, and the sixth row contains 10 characters. The characters are Braille letters and numbers, with some characters highlighted by blue boxes.

Figure 1: A visualization of the proposed model. The figure shows a sequence of 10 input frames (rows) and their corresponding output frames (columns). The input frames are represented by a grid of black dots on a white background. The output frames are represented by a grid of black dots on a white background, with some frames showing a blue square highlighting a specific region. The output frames are arranged in a 2x5 grid, with the first row containing the first five frames and the second row containing the last five frames. The blue square highlights the region of the input frame that is used to generate the output frame.

The image displays a 10x10 grid of 100 3x3 dot patterns. Each pattern is a 3x3 grid of dots, some of which are highlighted in blue. The highlighted dots form a larger 10x10 grid pattern across the entire image.

Figure 1: A visualization of the proposed method. The figure displays a grid of 10 rows and 10 columns of handwritten digits. Each digit is represented by a 10x10 grid of dots. The digits are arranged in a 10x10 grid, with each digit occupying a 10x10 sub-grid. The digits are: Row 1: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 2: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 3: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 4: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 5: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 6: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 7: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 8: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 9: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 10: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0. The digits are arranged in a 10x10 grid, with each digit occupying a 10x10 sub-grid. The digits are: Row 1: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 2: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 3: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 4: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 5: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 6: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 7: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 8: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 9: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; Row 10: 1, 2, 3, 4, 5, 6, 7, 8, 9, 0.

Figure 1: A visualization of the proposed method. The figure shows a sequence of 10 frames of a video. Each frame is a 2D grid of pixels. The frames are arranged in a 2x5 grid. The first frame is the input image. The subsequent frames show the results of the proposed method, with the detected object (a person) highlighted by a blue bounding box. The bounding box is shown in the first frame and then in the subsequent frames, indicating the object's position and movement over time.

Figure 1 shows a 6x10 grid of 60 Braille characters. The characters are arranged in 6 rows and 10 columns. The first row contains 10 characters, the second row contains 10 characters, the third row contains 10 characters, the fourth row contains 10 characters, the fifth row contains 10 characters, and the sixth row contains 10 characters. The characters are Braille letters and numbers, with some characters highlighted in blue boxes.
